

LAABS Audio - One-Page App Summary

Evidence source: repository files under `src/`, `docs/`, and `package.json`

What It Is

LAABS Audio is an Expo Router React Native app that connects to Audiobookshelf for mobile audiobook listening. The codebase implements login, library browsing/search, streaming playback, and offline download flows.

Who It Is For

- Primary persona: people who run or access an Audiobookshelf server and want a mobile listening client.
- Product/market positioning statement: Not found in repo.

What It Does

- Sign in with server URL, username, and password; stores credentials/tokens and refreshes sessions automatically.
- Pick an active library and switch libraries from settings.
- Browse/search library books with filters (title/author/description, genres, tags) and cached query data.
- Open book detail pages with metadata, cover art, and transport controls.
- Stream audiobooks from Audiobookshelf sessions with play/pause, skip, seek, and chapter navigation.
- Download audiobooks for offline playback with progress, cancel, and delete controls.
- Sync playback/bookmark changes when online and preserve local state for offline use.

How It Works (Architecture)

- UI: Expo Router screens/tabs in `src/app` call hooks and feature components (for example `LibraryContainer`, `BookContainer`).
- State/cache: Zustand stores (`auth/books/playback/settings`) persist via MMKV; React Query cache persists via `mmkvQueryPersister`.
- Auth/data access: login/refresh in `src/auth/*`; API modules in `src/api/*` call `absClient` -> `authFetch` -> Audiobookshelf endpoints.
- Playback flow: book controls -> `playerService` -> `audio-engine` -> `react-native-audio-pro`; progress sync uses `sessionsApi` and `meApi`.
- Offline flow: download actions in `store-books` plus file helpers write local files; pending bookmark operations sync on reconnect.

How To Run

- Install dependencies: `npm install`
- Start the app: `npx expo start`
- Launch on a simulator/device from Expo CLI (iOS/Android), then open the app.
- Sign in on the login screen with your Audiobookshelf server URL, username, and password.
- Local backend setup/example server credentials: Not found in repo.
